## Green group catalogs world's 10 worst pollution problems

The world's worst pollution problems kill millions of people each year and sicken hundreds of millions of others, mostly in developing countries, according to a <a href="mailto:new-report">new-report</a> from green group Blacksmith Institute. For the <a href="past-few years">past-few years</a>, the group has ranked the world's top 10 most-polluted sites in order to focus global attention and fuel efforts to clean them up. This year, however, the group broke slightly with its own tradition and instead focused on the worst pollution problems. In no particular order, the world's top pollution problems include <a href="mailto:small-scale-gold-mining">small-scale-gold-mining</a>, contaminated surface water, <a href="mailto:contaminated-groundwater">contaminated groundwater</a>, <a href="mailto:indo-rair-pollution">indo-rair-pollution</a>, <a href="mailto:industrial mining">industrial mining</a>, low-tech lead-battery recycling, <a href="mailto:metal smelting-and-processing">metal smelting-and-processing</a>, <a href="mailto:poor-urban air-quality">poor-urban air-quality</a>, radioactive waste and <a href="uranium mines">uranium mines</a>, and <a href="untreated sewage">untreated sewage</a>. "The global health burden from pollution is astonishing, and mainly affects women and children," said Richard Fuller, director of Blacksmith Institute. "The world community needs to wake up to this fact. Clean air, water, and soil are human rights."
